

Gemjar Commerce Platform Solution Scope & Delivery Blueprint

Independent Commerce Platform with Flexible Integration

Prepared for Gemjar
Prepared by Artistry Design Ltd
August 2026

This document outlines the proposed approach, functional deliverables, technical architecture and indicative delivery plan for Gemjar's new digital commerce platform.

1. Executive Overview

The proposed solution is a new, independent digital commerce platform for Gemjar that brings together B2C ecommerce, B2B trade customers and sales-agent workflows within one central platform.

Unlike an approach where the new platform is heavily dependent on Sage 50 or Mintsoft, the core Gemjar platform will remain independent from any individual third-party operational system. The platform will maintain its own structured product, customer, pricing and order data while providing flexible mechanisms for exchanging information with existing systems such as Sage 50 and Mintsoft.

Where direct API integration is appropriate, the platform can exchange data automatically. Where integration is not required, unavailable or not commercially appropriate, authorised users can export and import structured data for processing within existing systems.

Strategic objective: Build Gemjar a future-ready commerce platform that can work with today's operational systems without making those systems permanent dependencies.

2. Platform Vision

The platform will provide three connected experiences:

- **B2C Ecommerce:** consumer product discovery, purchasing, accounts and order tracking.
- **B2B Trade Portal:** approved trade customers access customer-specific pricing, ordering, reordering, invoices and account information.
- **Sales Agent Portal:** sales agents manage only their assigned customers and can place orders on their behalf.

The three experiences will operate through a central Gemjar platform and database, with a dedicated integration and data-exchange layer connecting to external systems where required.

3. Core Platform Foundation

- Centralised product catalogue
- Up to 500 initial SKU migration/setup
- Product categories and subcategories
- Product attributes and specifications
- SKU and product status management
- Product availability and visibility controls
- Product search and filtering
- Customer management
- B2B account management
- Sales-agent management
- Customer-to-agent assignment
- Customer-specific pricing
- Order and shipment management
- Address management
- Platform-wide activity history
- Role-based permissions
- Centralised operational dashboard

- Responsive web application
- SEO-ready architecture

4. B2C Ecommerce Experience

Core Deliverables

- Modern Gemjar storefront
- Responsive/mobile-first experience
- Product catalogue and categories
- Product search and filtering
- Product detail pages
- Related and recommended products
- Recently viewed products
- Quick-add to basket
- Stock availability indicators where data is available
- Shopping basket and persistent basket
- Checkout and payment integration
- Order confirmation
- Customer registration/login
- Customer profile and address management
- Customer order history and order details
- Delivery/tracking information where available
- SEO foundations and structured product metadata

5. B2B Trade Portal

Trade Dashboard

- Recent orders
- Outstanding orders
- Recent purchases
- Frequently ordered products
- Products available to reorder
- New products
- Latest invoices
- Delivery/tracking updates where available
- Account information

Advanced Ordering

- Standard product ordering
- Quick order
- SKU-based ordering

- Bulk quantity entry
- One-click reorder
- Reorder from previous orders
- Saved/favourite products
- Frequently ordered products
- Minimum order quantity validation
- Pack quantity validation
- Customer-specific pricing
- VAT calculation
- Order notes
- Order review before submission

B2B Account Management

- Company profile
- Contact information
- Multiple delivery addresses
- Billing address
- Order history and order details
- Invoice history and access
- Reorder functionality
- Saved products
- Account preferences
- Contact sales

6. Customer-Specific Pricing Engine

B2B pricing will be designed around the confirmed requirement that pricing is set per individual customer.

- Customer-specific pricing
- Product-level customer pricing
- Bulk pricing rules where required
- Minimum order quantities
- Pack quantities
- VAT rules
- Pricing validation
- Customer-specific price visibility
- Pricing import/export
- Pricing audit history
- Effective dates where required

7. Sales Agent Command Centre

Agent Dashboard

- Recent orders
- New customers
- New products
- Outstanding customer orders
- Reorder opportunities
- Recently active customers
- Recent invoices
- Customer purchasing activity

Customer Management

- Assigned customer list
- Customer search
- Customer profiles
- Customer order history
- Customer invoices
- Customer-specific catalogue and pricing
- Place orders on behalf of customers
- Reorder previous products
- Customer switching
- Order attribution
- Agent activity/history

Sales Agent Order Builder

- Select customer
- Search products
- Add quantities
- Automatically apply customer pricing
- Validate pack quantities and MOQs
- Calculate VAT and totals
- Confirm order
- Attribute order to agent and customer

8. Order & Fulfilment Centre

- Unified order records across B2C, B2B and agent-created orders
- Order status tracking
- Order history and detailed order views
- Order attribution
- Customer order timeline
- Shipment tracking

- Dispatch status
- Partial shipment support
- Shipment-level status
- Tracking information
- Order notes
- Cancellation status
- Return status
- Integration status

Partial shipments: This will be treated as a core requirement rather than an edge case, reflecting the client's confirmation that partial shipments are very important.

9. Customer Order Timeline

A visual order timeline can provide a consistent view of fulfilment progress across the platform.

Example: Order Placed → Confirmed → Processing → Partially Dispatched → Dispatched → Delivered

Where available, external fulfilment and tracking information can be incorporated into the timeline.

10. Intelligent Reordering

- Reorder a previous order
- Reorder individual products
- Frequently ordered products
- Saved products
- Quick order
- Automatic application of customer-specific pricing
- Previous order visibility

11. Integration & Data Exchange Centre

The platform will include an integration and data-exchange layer so Sage 50 and Mintsoft can be connected where appropriate without becoming foundational dependencies.

Integration Dashboard

- Integration status
- Last successful synchronisation
- Failed synchronisations
- Pending synchronisations
- Import history
- Export history
- Error messages
- Retry status

Supported Data Exchange Areas

- Products

- Customers
- Pricing
- Orders
- Stock
- Shipments
- Tracking
- Invoice references

12. Import & Export Centre

Export

- Structured order exports
- Product exports
- Customer exports
- Pricing exports
- Stock-related exports
- Shipment information exports
- CSV and Excel-compatible formats where appropriate
- System-specific formats where technically supported

Import

- Structured data upload
- Pre-import validation
- Error reporting
- Review before commit
- Import history
- Duplicate detection
- Field/data validation

Exact mappings and file formats will be confirmed during technical discovery based on the capabilities of the relevant external systems.

13. Integration Resilience

- Integration logs
- Failed transaction tracking
- Retry processing
- Duplicate prevention
- Data validation
- Synchronisation status
- Error reporting
- Background processing

- Separation of customer-facing functionality from external-system availability

14. Notifications & Operational Alerts

- New order notifications
- Order status changes
- Partial shipment notifications
- Dispatch notifications
- Tracking updates
- New B2B account applications
- New customer notifications
- Integration failure alerts
- Import failure alerts
- Stock-related alerts where appropriate

15. Audit Trail

- Customer creation and updates
- Pricing changes
- Order creation and modification
- Agent order attribution
- Import activity
- Export activity
- Integration activity
- Administrative changes
- User/activity history

16. Role-Based Security

- **Consumers:** access to their own account and orders.
- **B2B Customers:** access to their trade account, pricing, orders, invoices and associated information.
- **Sales Agents:** access only to their assigned customers and associated information unless explicitly authorised otherwise.
- **Internal/Admin Users:** access according to assigned permissions.

17. Search & Discovery

- B2C search by product, SKU, category and relevant attributes
- B2B search across the customer's available catalogue
- Sales-agent search by customer, product, SKU and order
- Advanced filtering
- Mobile-friendly search experience

18. Analytics & Business Visibility

Indicative Dashboard Metrics

- B2C orders and revenue
- Top-selling products
- B2B order activity
- Top customers
- Frequently ordered products
- Orders by sales agent
- Customer activity by agent
- Pending orders
- Partially shipped orders
- Dispatch status
- Integration failures

The exact reporting depth and KPIs can be confirmed during discovery.

19. Responsive & Mobile Experience

- Responsive B2C storefront
- Mobile-friendly B2B ordering
- Mobile-friendly sales-agent workflows
- Touch-friendly controls
- Optimised layouts for common device sizes
- Consistent experience across desktop, tablet and mobile

20. SEO & Performance Foundations

- Search-engine-friendly page architecture
- Product metadata
- Clean URLs
- Semantic page structure
- Optimised product pages
- Responsive implementation
- Performance-conscious development

21. Future-Ready Architecture

The platform will be designed so external systems can be added, replaced or removed without requiring the core commerce platform to be rebuilt.

- Alternative accounting systems
- Alternative fulfilment systems
- ERP platforms
- Additional payment providers
- Additional logistics providers

- Other business systems

Key architectural principle: Sage 50 and Mintsoft are integration targets, not the foundation of the Gemjar commerce application.

22. Technical Stack

Layer	Technology	Purpose
Frontend	Next.js 15	B2C storefront, B2B portal, sales-agent portal
Language	TypeScript	Strongly typed application development
UI	Tailwind CSS	Responsive styling and design system
Components	shadcn/ui	Reusable interface components
Motion	Framer Motion	Appropriate UI transitions and interactions
Backend	NestJS	API, business logic and integrations
Database	PostgreSQL	Core commerce and operational data
Integration	API + Data Exchange Layer	External system connectivity and structured import/export
Processing	Background Jobs / Queue	Asynchronous synchronisation, retries and scheduled processing

23. Proposed Delivery Approach

Phase	Indicative Duration	Key Activities
1. Discovery & Architecture	2 weeks	Business rules, data ownership, Sage/Mintsoft validation, integration strategy, import/export requirements
2. UX/UI & Portal Mapping	3 weeks	B2C, B2B and sales-agent journeys, dashboards, ordering workflows and responsive layouts
3. Core Platform	3–4 weeks	Database, backend, authentication, permissions, products, customers, pricing and orders
4. Commerce Experiences	3 weeks	B2C storefront, checkout, accounts, B2B portal and sales-agent workflows
5. Integration & Data Exchange	3–4 weeks	API integrations, import/export, mapping, synchronisation, logging and retries
6. QA & UAT	3 weeks	Functional, integration, responsive, security and user acceptance testing
7. Launch & Stabilisation	1 week	Production deployment, final migration, verification and initial monitoring

Indicative overall delivery: 18–22 weeks. Some phases will run concurrently. The final schedule will be confirmed after technical discovery and validation of third-party system access and requirements.

24. Scope & Integration Assumptions

- The initial product catalogue is assumed to be approximately 500 SKUs.
- B2B pricing is assumed to be customer-specific.
- Mintsoft is currently the definitive stock source, subject to the agreed future architecture.
- Partial shipments are treated as a core fulfilment requirement.
- Sales agents are restricted to their assigned customers unless explicitly authorised.
- Sage 50 and Mintsoft integration methods will be validated before final implementation.
- Where direct integrations are not required or technically appropriate, agreed structured import/export processes can be used.

- Exact third-party data mappings, file formats, synchronisation frequencies and API capabilities will be confirmed during technical discovery.
- Detailed internal administration, returns, cancellation rules, payment-provider specifics and other items not fully defined in the discovery materials will be finalised during scoping.

25. Next Step

The recommended next step is a focused technical discovery and architecture phase. This will convert the current business requirements into an agreed technical blueprint, confirm data ownership and integration methods, map the key portal screens, and establish the final fixed implementation scope.

Following this phase, the project can proceed into design, development, integration, testing and launch against an agreed delivery plan.
